

Lesson: HTML Attributes

August 29, 2018

Objective

Last class we covered HTML elements, Today we will learn about HTML attributes.

HTML Attributes

- All HTML elements can have attributes
- Attributes give more information about elements
- Attributes are specified in Start tag
- Attributes are always key-value pair

HTML Attributes Example

```
<a href="https://www.w3schools.com">This is a link</a>
```

Guess which one is the attribute here?

```
img src="img_girl.jpg">
```

```

```

```

```

```
<p style="color:red">I am a paragraph</p>
```

Git Commands

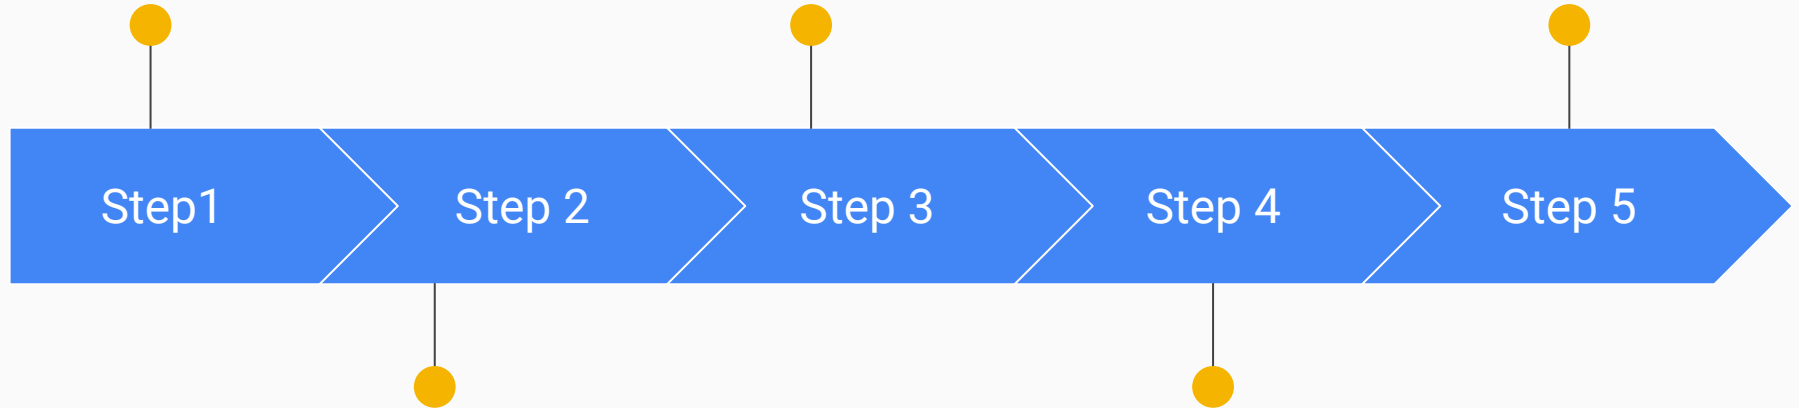

<https://confluence.atlassian.com/bitbucketserver/basic-git-commands-776639767.html>

Lets quickly review it

Develop your HTML code in your workstation

Now to make it public , push all your files to public_html in loki.

Finally Test your code

After you test locally, If everything is good. You can push your code to Git or copy using Winscp.

Sync all your files, check if all your files exist in public_html

Lab 2- Extension

Previous Lab you should have the files copied manually via Winscp and used unix command .

Do you like that process ?

I don't like it, I am just going to show it how simple it is going to be using Git.

You can choose which one you want to use it copying files manually or using Git.

(If you plan to be a software Engineer in future and work for an enterprise they prefer the Git method)
